

Introduction to Programming

Important Questions

(Extracted from Previous and Model papers)

2 Mark Questions

1. Show the basic structure of a computer.
2. List out the characteristics of an algorithm.
3. Differentiate break and continue statements.
4. Label the syntax of switch statement.
5. Define an array.
6. What is \0 in string?
7. How to declare a pointer?
8. Summarize the advantages of functions
9. Name the user defined data types in C.
10. Classify the files.
11. Show the basic structure of a computer.
12. List out the characteristics of an algorithm.
13. Differentiate break and continue statements.
14. Label the syntax of switch statement.
15. Define an array.
16. What is \0 in string?
17. How to declare a pointer?
18. Summarize the advantages of functions.
19. Name the user defined data types in C.
20. Classify the files.
21. Write the differences between RAM and ROM
22. What are the logical operators in C
23. Explain goto statement with example
24. Write a program to display whether a given year is leap year or not
25. Explain strcmp() function.
26. What is a subscript. How it is used to access an array element
27. What is a preprocessor directive
28. What is the purpose of free().
29. Define bit field.
30. What is the purpose of fseek()
31. Write the differences between Compiler and Interpreter
32. Explain conditional Operator
33. Explain do while statement.
34. Write a program to display whether a given number is even or odd

35. What are the differences in reading of string using gets() and scanf() statement.
36. What is an multidimensional array.
37. What is a chain of pointers
38. Differentiate user defined and library functions.
39. What is an array of structure
40. What are the modes used in fopen().

Long Answer Type Questions

Unit-1

1. Explain the primitive datatypes available in C language.
2. Assess the mechanism for type conversion and casting.
3. Analyze the approach of problem-solving strategies
4. Name the operators used in C and show the usage of each operator.
5. Explain the primitive datatypes available in C language.
6. Assess the mechanism for type conversion and casting.
7. Analyze the approach of problem-solving strategies.
8. Name the operators used in C and show the usage of each operator.
9. Explain the functional diagram of computer
10. What are the characteristics of an algorithm? Write an algorithm for displaying the area of a triangle.
11. Explain the structure of C Program.
12. Explain Bitwise operators. Write a program for demonstrating bitwise operators
13. What is a software? Explain the differences between application software and system software
14. What are the symbols used in flowcharts. Draw the flow chart for displaying division of a student,
15. Explain the fundamental data types in C.
16. Explain the Input and output statements in C.

Unit 2

1. Illustrate the operation of while statement with example.
2. Design a C program to perform arithmetic operations using the switch statement.
3. Develop a C program to calculate the sum of digits of an individual number.
4. Elaborate the usage of various forms of 'if' statement.
5. Illustrate the operation of while statement with example.
6. b) Design a C program to perform arithmetic operations using the switch statement.
7. Develop a C program to calculate the sum of digits of an individual number.
8. b) Elaborate the usage of various forms of 'if' statement. Discuss if else statement with an example program

9. Explain switch statement. Write a program for displaying whether a given character is vowel or not using switch statement.
10. Differentiate while loop with do while loop. Demonstrate while and do while with an example
11. Write a program to display whether a given number is prime or not.
12. Explain else if ladder. Write a program for displaying the roots of quadratic equation with else if ladder.
13. Write a program for displaying the areas of different geometric shapes using switch statement.
14. Explain for statement. Write a program to generate n terms of the Fibonacci series.
15. Write a program for displaying whether a given number is Armstrong or not.

Unit 3

1. Show the functionality of any five string handling functions.
2. Create a C program to perform addition of two matrices.
3. Demonstrate the procedure for using the two-dimensional arrays.
4. Write a C program to print a string in the reverse order.
5. Show the functionality of any five string handling functions.
6. Create a C program to perform addition of two matrices
7. Demonstrate the procedure for using the two-dimensional arrays.
8. Write a C program to print a string in the reverse order..
9. What is an array? Explain the declaration, initialization of one dimensional arrays.
10. Write a program to multiply two two dimensional arrays.
11. Explain how the two dimensional arrays are declared, initialized and accessed.
12. Write a program to sort an array.
13. What is a string? Explain the declaration, initialization, reading and displaying of a string.
14. Write a program for sorting an array of strings.

Unit 4

1. Outline the process of function declaration and definition
2. Develop a C program to sort an array using the pointers.
3. Design a C program to display the Fibonacci series using recursion.
4. Show the strategy of call by value and call by reference.
5. Outline the process of function declaration and definition.
6. Develop a C program to sort an array using the pointers.
7. Design a C program to display the Fibonacci series using recursion.
8. Show the strategy of call by value and call by reference.
9. Write a program for reversing a string with out using string handling function.
10. Explain any five string handling functions defined in string.h library
11. Explain the elements of user defined function.

12. What is a recursion. Write a recursive program for Fibonacci series
13. Discuss how arrays are represented using pointers
14. Differentiate call by value and call by reference.
15. Discuss the types of functions based on input parameters and return values.
16. Explain the storage classes.
17. What is a pointer? Explain how the pointer is declared, initialised and accessing a variable through its pointer.
18. Write a program for sorting an array using pointers.

Unit 5

1. Examine the concept of accessing and initialization of structure variable.
2. Write a C program to perform addition of two numbers using the command line arguments.
3. Differentiate the features of a structure and union.
4. Create a C program to display the content of a file.
5. Examine the concept of accessing and initialization of structure variable.
6. Write a C program to perform addition of two numbers using the command line arguments.
7. Differentiate the features of a structure and union.
8. Create a C program to display the content of a file.
9. What is a structure? Explain the definition, initialization and accessing of structure variables
10. Write a program for displaying division of a student using a structure containing regd no, name and marks in three subjects.
11. Explain functions used for input and output operations on files
12. Write a program for merging of two files
13. Explain Nested Structures with an example.
14. Differentiate structures and unions with an example program.
15. Write a program for copying contents of one file to another
16. Explain the functions used for random access files.
